

## **Rebuttal – Group 13**

### **For reviewer 2:**

1. The first initial split is only used to test the feasibility of training and testing all models as a sample. It should not be seen as a WRONG.
2. For linear models, the absolute value of coefficient is also a sign of characteristic importance.
3. We DO USE recursive evaluation and tuning parameters after testing the feasibility in part 1. The first part of Part1 is only for testing. If you want to run the models successfully in the coding part, you should use the database constructed by us.
4. We also noticed that some group may have an overly high standard when reviewing others' projects. We think it's better to read the report carefully and adopt the same standard as they do with respect to their own project to draw a fairer and more just conclusion.
