For reviewer1（tangtszhong）:

First, in terms of writing, this student is a little picky, our diagrams are relatively clear. And I think there's nothing wrong with screenshots as long as the results are clear.

Second, the homework requirements are the same whether it is a team of one or several people. We don't think we should be blamed for fitting six models.

Third, the Lasso and Ridge models have different results, and we explain them in detail. Theoretically we don't think these two models can be viewed as one. Moreover, for the lasso model, we have done regularization processing on it, which may be the reason why the importance of its factors is the same.

In general, we think that readers are too pursuing perfection, and the suggestions made have little reference meaning. It seems that points are deducted for deduction, so we do not agree with the score of 3 points.
